

5G Challenges and Mitigations

Quick Reference Table

CHALLENGE	RECOMMENDED MITIGATION
Ill-defined enterprise 5G use case	<p>Create a team, representative of the whole enterprise, to plan for 5G integration</p> <p>Ensure board buy-in</p>
<p>Connection to new 5G cores (responsible for network security) for international roaming will be required on both ends of the communication to ensure the advertised security benefits</p> <p>Communicating through a mix of 5G networks and LTE, 3G, and 2G networks (rather than all-5G) exposes the 5G network to the same vulnerabilities of the legacy network</p>	<p>Clearly define the use case as a basis for security planning and additional security protocols</p> <p>Build 5G security protocols off existing 4G security standards</p>
A dearth of 5G-related technical expertise in the enterprise	Evaluate availability of applicable talent and augment or train as needed
<p>Appropriate network-wide risk management practices will take time to develop and may trail the introduction of the network</p> <p>Service providers face increased demand for, and spreading of, maintenance costs and investment decisions across multiple network generations – this will likely lead to 5G rollout delays</p>	<p>Use the determination of the enterprise use case to create an optimum adoption timetable</p> <p>Understand the limitations of service providers and third parties</p>
5G services currently lack the support hardware required to take advantage of its added security and will continue to be accessed through less secure LTE, 3G, and 2G user equipment	<p>Build 5G security protocols off existing 4G security standards</p> <p>Develop a workable threat identification plan</p>
<p>Decoupling hardware and software suppliers will introduce further complexity and associated risk</p> <p>The internet of things will become synonymous with the Radio Access Network (RAN), introducing new security ‘back doors’</p>	<p>Create an employee 5G use policy</p> <p>Develop a connected devices integration plan</p> <p>Develop a workable threat identification plan</p>
5G hardware will be vulnerable to the introduction of malware during manufacture	<p>Understand the limitations of service providers and third parties</p> <p>Employ thorough hardware vetting and standards enforcement</p>
<p>Network Slicing</p> <p>Insufficient security patch management</p>	Develop a patch management plan
